

A

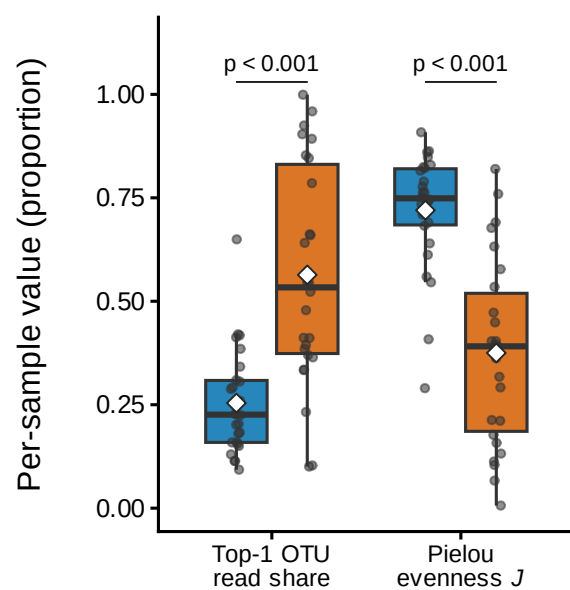

Asymptotic diversity of the pooled season (iNEXT3D, incidence, 500 bootstraps); bars are 95% CIs.
Summer exceeds winter at every order, and no pair of intervals overlaps.

**B**

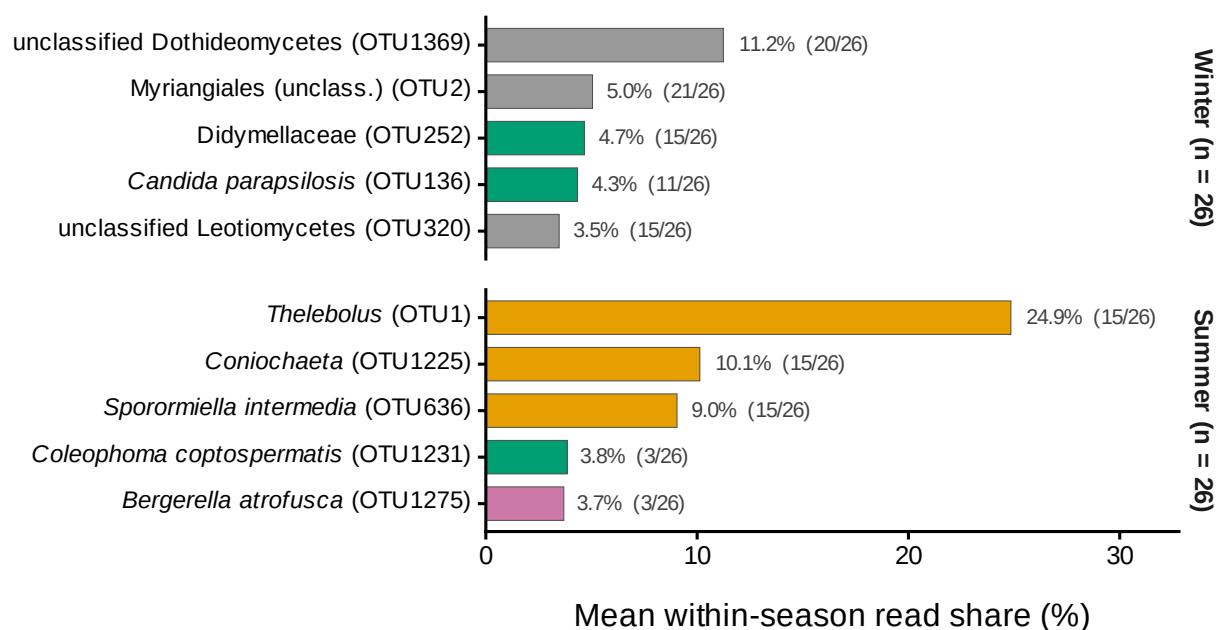

Per-sample Hill numbers ($n = 52$, rarefied to 12,615 reads); white diamonds are season means.
Annotations: PCR-replicate-level mixed model ($n = 98$; Table S9).

**C**

White diamonds are season means;
brackets give the Wilcoxon rank-sum test (Table S10).

**D**

Bar labels give the mean share and, in parentheses, the number of that season's samples with any detection.
